# Equine Vaccine Storage and Handling Guidelines

Equine vaccines should be stored between 35 and 45 degrees F (2-7 degrees C).

- 1 AVOID FREEZING!** Never use killed vaccines, bacterins or toxoids that have been frozen or that are suspected to have been frozen.
- 2 AVOID “DORMITORY-TYPE” REFRIGERATORS** It is difficult to ensure consistent temperatures throughout the interior of these simple units. If using these small refrigerators, monitor interior temperatures closely, particularly near the freezer area. Larger, modern frost-free refrigerators with separate freezers typically circulate the air within, ensuring more uniform temperatures throughout the refrigerator compartment.
- 3 ALWAYS** question any vaccine that is not the usual color or appearance upon receipt or that has changed color or appearance during storage or usage.
- 4 ALWAYS** use a new (unused) needle of appropriate length for each dose of vaccine to ensure optimal intramuscular administration.
- 5 NEVER** combine two (or more) vaccine Dose in the same syringe to make “custom” combination vaccines.  
Antigen interference, adjuvant interference and/or adjuvant overdose associated with this practice can result in significant vaccine efficacy and safety (injection site and systemic reaction) problems.
- 6 ALWAYS** shake multi-dose vials thoroughly prior to initial use and between individual dose withdrawals to ensure uniform distribution (and dosing) of vaccine components that may settle out rapidly.
- 7 ALWAYS** disinfect vaccine stoppers prior to use with an alcohol swab. Allow sufficient time for the residual alcohol to evaporate prior to needle puncture.
- 8 ALWAYS** use the entire contents of a multiple-dose vaccine vial within a reasonable amount of time after initial opening/puncture and employ practices that minimize the number of entries into the vial.
- 9 NEVER** administer two (or more) vaccine Dose at the same injection site or in close proximity to another injection site.
- 10 AVOID** dispensing single-dose vaccines in unmarked syringes filled from multi-dose vials. Dispense pre-filled, single-dose syringes designed and labeled by the manufacturer whenever possible.
- 11 ALWAYS** treat lyophilized vaccines with additional care
  - Use only the diluent provided with the vaccine
  - Use immediately after rehydration and protect from heat and light until administered
  - Do not freeze either before or after reconstitution
